TITLE: The influence of temperature on the strength of etched quartz glass in a high-strength state

SOURCE: Fizika tverdogo tela, v. 8, no. 5, 1966, 1504-1510

TOPIC TAGS: quartz glass, glass property, temperature effect, glass product

ABSTRACT: It has been shown elsewhere that the strength of bulk sheet glass after etching in hydrofluoric acid solutions may be unusually high if the working surface of the glass is thoroughly protected from accumulations of defects before and during the experiment. The present investigation attempts to extend this finding to commercial bulk quartz glass and to study the influence of the temperature and the heat treatment on the strength of the quartz in its high-strength state (about 300 kg/mm²). It is found that if the action of the irreversible heat processes which softens the glass and the influence of moisture in various manifestations are excluded, the strength of the quartz glass in the 50—400C temperature range is independent of

TITLE: Influence of ultrasonics on barnacles in the larval state using a frequency of 23 kilocycles/sec

SOURCE: AN SSSR. Doklady, v. 166, no. 1, 1966, 250-252

TOPIC TAGS: animal physiology, ultrasonic radiation, *ultrasonic radiation on larvae*

ABSTRACT: The experiments were conducted on Balanidae barnacles in the larval state. The size of sonic pressure varied from $6 \cdot 10^4$ to 10^6 bar and the time of exposure from 1 to $6 \cdot 10^2$ sec. A magnetostrictive emitter working continuously on a resonant frequency of 23.5 kilocycles/sec was used as a source of ultrasonic radiation. The Balanidae larvae subjected to radiation were placed in a specially constructed vessel having a 3 cm^3 volume. The sonic pressure in the vessel was distributed uniformly, correct to $\pm 10\%$. The percent of destruction of larvae after radiation varied from 10% to 90% in $\pm 10\%$. The direct relation to the sonic pressure variation of from 100,000 to 150,000 bar. The experiments showed that the specimens most susceptible to sonic pressure were in the mauplius and in the beginning of the metamauplius forms. Barnacles in the precypris

Card 1/2

ACC NR: AP6C03496

form have an increased resistance to sonic pressure. These findings can be used for the protection of water conduits and other installations from overgrowth. Experiments were also conducted with metal sheets placed in the sea and activated by magnetostriuctive emitters. The experiments showed that by using a frequency of about 20 kilocycles/sec the threshold pressure value, when the influence of ultrasonics begins to affect the overgrowth, is about 60,000-70,000 bar. Lower pressure does not affect the overgrowth process. The paper was presented by Academician Andreyev, N.N., 21 Feb 65.

TITLE: The problem of the representativeness of the wind at the Tiksi Bay polar station

SOURCE: Leningrad. Arkticheskiy i antarkticheskiy nauchno-issledovatel'skiy institut.
Problemy* Arktiki i Antarktici; sbornik statey, no. 16, 1964, 41-43

TOPIC TAGS: wind, wind direction, meteorology, polar meteorology

ABSTRACT: The meteorological station at Tiksi Bay was organized in 1932 on the shore of Sogo Gulf. Beginning in January, 1957 it occupied a new site 14 km to the north of its former site. Tiksi Bay is surrounded on the south by mountains which considerably distort the direction of the principal air currents. The coefficient of representativeness of wind direction at the earlier site was determined in the past (V. M. Shapayev, Tr. Arkt. in-ta, Vol. 217, Leningrad, Izd-vo Morskoy Transport, 1959). Using the same method, the author has obtained the coefficient of representativeness of wind direction at the new site. Distortions of wind direction were determined by comparison with wind observations on Mostakh Island.

Card 1/2

ACCESSION NR: AT4041749

The latter station is unaffected by local relief and fully reflects the wind direction and velocity of the principal flow at Tiksi Bay; it therefore is assigned a coefficient of representativeness of 100%. Tiksi Bay has prevailing southwesterly and northeasterly flow, unlike the earlier site. In addition, in many cases frequency of winds of a particular direction differs sharply between Tiksi Bay and Mostakh Island. At Tiksi Bay the coefficient of representativeness has the following values in comparison to the reference station: winter - 44%, spring - 60%, summer - 64%, autumn - 86% and mean annual - 64%. These values differ insignificantly from those for the former station site. Orig. art. has: 3 figures.

Amongst 49 cases of cirrhosis of the liver 5% (chiefly older patients) showed a longitudinal grooving of the nails. In these patients hyp siderolemia was also frequently found. A less frequent finding was flat nails with normal plasma iron content. No relationship was found between changes in the nails and the amount of haemoglobin, the blood proteins and the liver function tests.

PURPOSE: The book is intended for engineers and scientists engaged in the study and manufacture of plastics and plastic machine parts.

COVERAGE: The chapters of this book were written by different authors indicated in parentheses after each chapter in the table of contents.

The chapter on the use of plastics in non-Soviet countries includes data on the Jitroda Works in Czechoslovakia. A number of Soviet manufacturing establishments are mentioned. Equipment using plastic parts is described and evaluated. Considerable attention is paid to nonferrous and chemical enterprises. Equipment using plastic or substituting plastics for critical materials is related to the problems subjected to severe corrosive, abrasive and chemical influences. Brand designs, properties and uses of a number of Soviet-made plastic materials are given. It is thus a survey of modern Soviet plastic materials grouped according to their specific applications in industry. The authors rely heavily upon the experience of Ural plants, especially those producing electrical apparatus, automotive equipment, and measuring instruments. No personalities are mentioned. There are 37 references.

ABSTRACT : Investigations were conducted in 1952-1954
at Buzuluk, to study moisture content of soil, condition
and development of spring-wheat plants, on irrigated and
non-irrigated fields -- of medium-loamy southern chernozems.
Consumption of soil moisture is higher with irrigation
than without (5-6 and 1-3 mm, respectively). Under
conditions of irrigation the effectiveness of soil-moisture
utilization is greater than without irrigation; moisture
expenditure per unit of grain harvest is 2 times less in
the former case. Irrigation results in greater intensity
of growth accretion, by 1.5-2 times; number of productive
stalks is increased by 1.8 times, while that of absolute

TITLE: The plane-parallel motion of a viscous fluid between rotating cylinders.

SOURCE: Vychislitel'nyye metody i programmirovaniye: sbornik rabot
Vychislitel'nogo tsentra Moskovskogo universiteta. no. 1. Ed. by
N. P. Trifonov, G. S. Roslyakov, and Ye. A. Zhigolev. [Moscow] Izd-vo
Mosk. un-ta, 1962, 152-166.

TEXT: The paper is intended to investigate the motion of a fluid by means of the direct numerical integration of the nonlinear Navier-Stokes equations. The direct objective of the investigation is the case of a viscous incompressible fluid in an x, y, z space contained between two infinite cylinders having radii $R_1^2 \leq x^2 + y^2 \leq R_2^2$ which rotate with different angular velocities. The behavior of the fluid in a plane solution (i. e., independent of z) is to be found. Upon establishment of the necessary matrix expression the solution of the problem on the machine "Strela" at the Computing Center of the Moscow State University is described. The program consists of 4 separate parts, (1) the shaping and the memory formulation of the distribution program, (2) the program of the calculating of coefficients, (3) the program of preparation of the initial data, and (4) the program of the solution of the difference equations.

Card 1/2

"The plane-parallel motion of a viscous fluid S/794/62/000/001/006/010

Calculations were made for 4 Reynolds numbers, namely, 200, 500, 1,000, and 2,000, with different timewise steps. It was found that in the largest network employed the eddies smoothed out and the flow became smooth and trivial. The time of establishment grew proportional to the R number. In all probability this network was exceedingly crude and had its own viscosity. The use of a fine network revealed a turbulent motion, if the degree of turbulence is intended to signify the number of eddies in the flow. The amplitude of the perturbations decreases with time, but turbulence grows and new eddies are formed, even though with smaller amplitudes. Ultimately, the motion in the network becomes smooth, since the network does not admit eddies of a size smaller than the dimensions of the network. Future work will comprise a reduction of the size of the network by one-half. Thanks are expressed to I. M. Gel'fond, corresponding member, AS USSR, for overall direction of the work and many valuable specific advices. There are 4 figures and 1 Russian-language Soviet reference.

The alkaloid content of Yugoslav *Colchicum autumnale* Alenka Mastnak-Regan (Pokusno polje "Biljana," Zagreb, Yugoslavia). *Acta Pharm. Jugoslav.* 1, 67-73 (1951) (French summary).—Colchicine (I) was detd. in all parts of the plant in different vegetative periods by Uffelle's method (C.A. 41, 1809g). The results are tabulated. The relative I content was highest in the flower (1.09%), lowest in the leaves above ground (0.30%); on the basis of wt. % of dried plant the tuber contained the highest amt. of I, the flower the lowest. The I content of the tuber was lowest in autumn (0.38%), highest in spring, especially in old tubers (0.82%). The I content of underground leaves decreased between May and June, when the leaves started to dry. The green seeds contained less I than the ripe ones: 0.47% and 1.0%, resp. (cf. Buchnik, *Pharm. Acta Heb.* 25, 388 (1950)). The analysis of green tubers and seeds gave lower results than the one of the corresponding dry material. S. Edmund Berger

1284. MODULATING CIRCUIT OF AN OSCILLOSCOPE C.R.

TUBE. J.Masner
Slabopronost Obrázek, Vol. 18, No. 11, 799-808 (1957). In Czech.

The control grid of the c.r. tube of an oscilloscope is sometimes supplied (apart from the normal black-out pulses) with rectangular pulses which modulate the brightness of the spot during its forward sweep and thus provide suitable time markers. Operation of the grid-modulation circuit is analysed in detail and it is shown that the following adverse effects can be encountered: (1) the pulses of the grid become distorted unless the coupling capacitance and the pulse source resistance are chosen correctly; (2) the grid is modulated by the ripple from the c.h.t. supply, but this can be remedied by using a bridge-type supply circuit; (3) change of the sensitivity of the tube unless it is supplied from a stabilized source; (4) defocusing of the spot which can be remedied by employing a special automatic refocusing circuit; and (5) cross-modulation due to the presence of stray capacitances. A modulation circuit, from which the above effects are eliminated, is described. R.B.Słodowicz //

TITLE: Differential Measuring of Two Frequencies by Modulation of Lissajous's Curve

PERIODICAL: Sdělovací technika, 1959, Nr 12, pp 449-450

ABSTRACT: Differential measuring of frequencies with Lissajous' curve is one of the basic methods of oscilloscope technique. In this article, the author shows that with standard laboratory equipment, it is possible to do such measurements by a modulation of Lissajous' curve. The way of searching for the correct modulation frequency, corresponding to the differential frequency, is the same as that used with stroboscopes. The correct frequency is the highest which give one single picture; its redoubling already results in a double picture. In his conclusion, the author describes the process of measuring. There are 3 pictures and 1 East-German reference. ✓

na péče po poranění mozku. Early rehabilitatory care after brain
injury ROZHL. CHIR. 1956, 35/11 (673-678)

During the initial period of treatment with bed rest, exercises are carried out directed toward fundamental vital functions, i.e. respiration and circulation. In the second period, when the patients are allowed to sit up, and in the third, when they are allowed out of bed, the author subjects the patients to carefully graduated exercises of progressively increasing complexity until convalescence. Particular attention is devoted to personal care and simple working tasks. Basic functional tests, each representing a standard stress to nervous activity, are used.

6336. NEUROLOGY IN SHOCK - Neurologie Šok - Maštný V. Výzkumný Úst. Traumatol.,
Brno - ROZHL. CHIR. 1958, 37/1 (15-17)
The psychiatric and neurologic aspects of both the eretic and torpid phase of shock were systematically followed. Muscle tone was examined by means of a special apparatus which made it possible to follow the changes of tissue tension along the whole limb circumference. The pH of sweat was determined by a universal indicator. The psychiatric and neurologic findings in shock differed from those in other neuropathologic states, similarities were seen to death from haemorrhage, asphyxia, exhaustion and some intoxications. The psychic and nerve responses were increased in the eretic phase, decreased or lost in deepening shock; direct dermography showed a change from red to white. Disturbances of consciousness and pyramidal phenomena pointed to brain complications. Vegetative changes and lowering of tendon reflexes were an early sign of a bad prognostic implication; normalisation of the psychiatric and neurologic findings followed within varying time after control of blood circulation disturbances. The possibility of a clinical shock evaluation with the help of neurologic and psychiatric examinations is pointed out. (VIII, 5)

Title: Filtration procedures used in the paper-making industry
Org. No.: Kharkov Institute, No. 6, 124-127 (1961)

Abstract: The authors report on an investigation of the possibility of the utilization of various filtration (F) methods (initial filters (IF), micro-filters (MF), coarse-micromicroporous, bacteriological filters (BF)) for filtering an asbestos-cellulose mixture 3% of which contains 10% asbestos mixed with cellulose. The use of F requires preliminary clarification of the pulp. MF are therefore used only in the final stage in the F process. The experiments were carried out at two plants in which a six-stage intermediate treatment of filter-pulp (FM) (diatomaceous earth (DE)) is practiced. The quality of the best filter

Abstract :	Increase the latter. PF through C-5 inhibited the formation of sludge for 7 days, whereas the use of K-3 resulted in a similar inhibition of only 6 days. The resistance to the development of turbidity was increased by 7 days in both cases. The increase in the resistance to settling was 5 days for C-5 discs and 7 days for K-3 discs. The maximum resistance to settling of beer filled into sterile bottles was found to be 15 days when C-5 and C-7 are used. It was found that the filter must be located downstream from the 'forfas' (?) in order to eliminate the danger of secondary contamination at the same time.

Abstract : the SF must be located at a considerable distance (30-40 m) from the filling equipment in order to equalize the pressure between the filter and the filling plant. Size n-grade 3-5 and 1-7 discs are recommended for application in SF; the filters should be designed for a capacity 10-15% above that of equivalent standard filters in order to allow for the addition of a greater amount of air to the SF. The sterilization of the SF is carried out with hot water; live steam will damage the disc. Silicic acid compounds are recommended for the lubrication of all valves.
